

Introducing Thola

A unified interface for communication with network devices

Tobias Berdin · Mika Meyer · Niklas Schon

Overview

Why is Thola that awesome?

- unified interface for communication with devices from Cisco, Juniper, Huawei, Nokia/ISAM and many more
- support for various devices like switches, routers, directional radio, UPS...
- easy way for adding additional device types

Why is Thola that awesome?

- usage of different protocols including SNMP, HTTP...
- compiled Go binary without dependencies
- low resource needs

open source

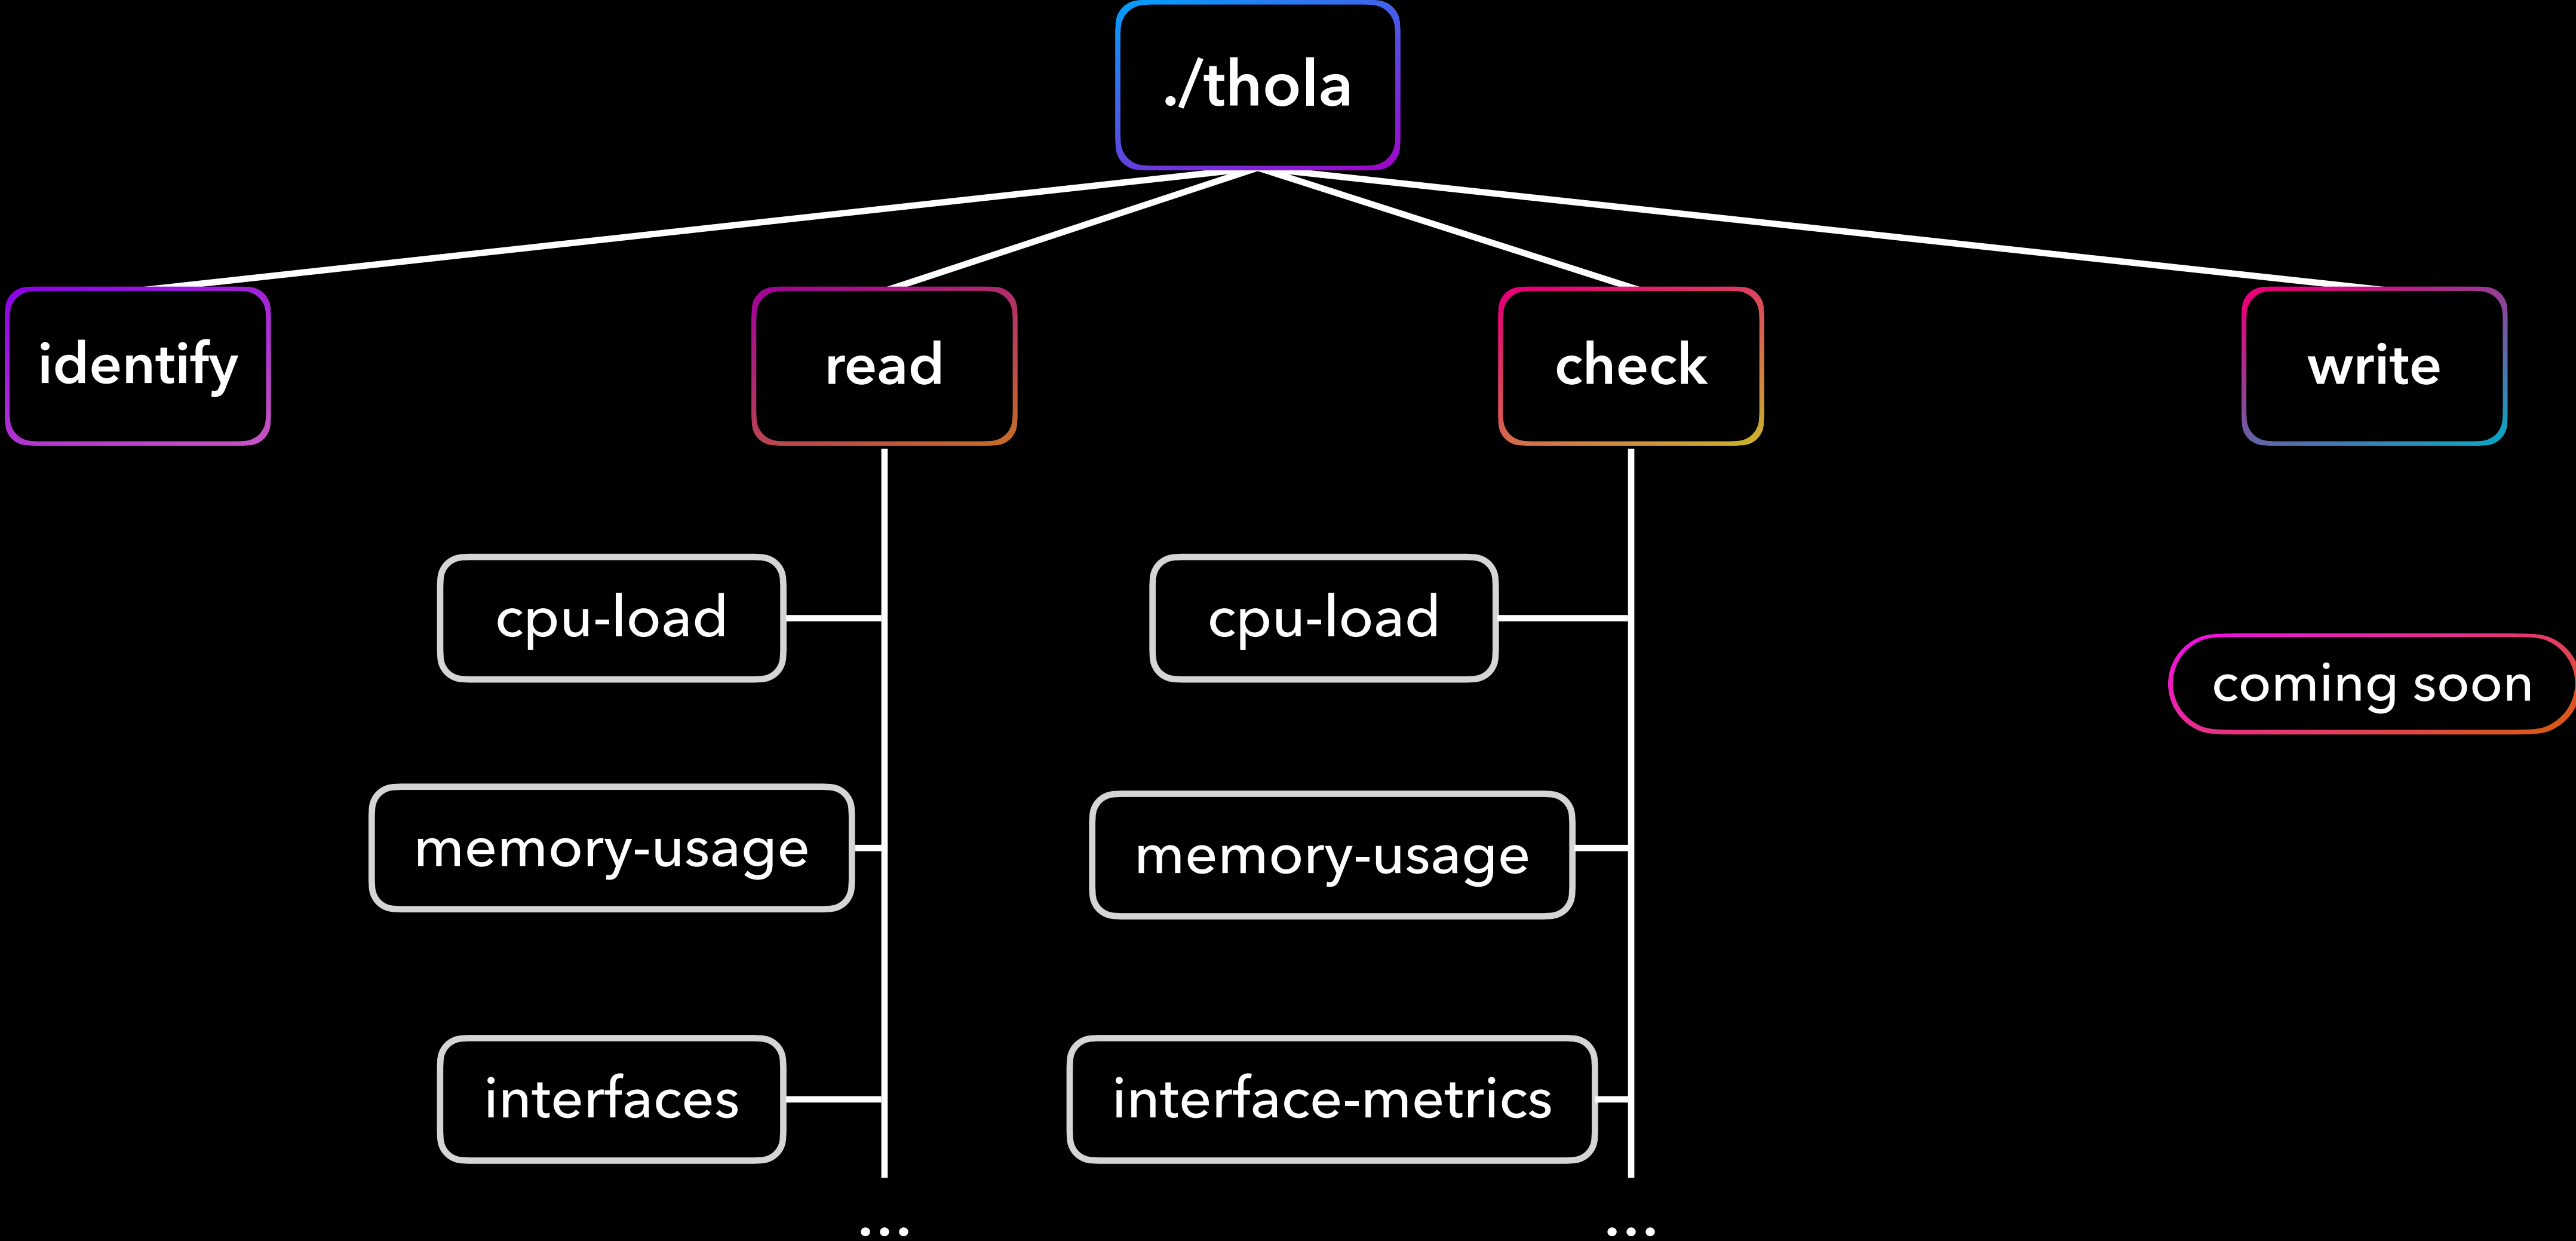

How to use Thola

- Command Line Interface
- Rest API
- Check Plugin
- Integration in other monitoring systems

coming soon

Operation modes

Operation modes

./thola identify

Automatically identify a device

```
$ thola identify --ip 10.204.2.90
```

```
Device:
```

```
Class: cerasos/ip10
```

```
Properties:
```

```
Vendor: Ceragon
```

```
Model: IP-10
```

```
SerialNumber: 00:0A:25:25:77:67
```

```
OSVersion: 2.9.25-1
```

./thola read interfaces

Read out special interface information

```
● ● ●  
  
$ thola read interfaces --ip 10.204.2.90  
  
Interfaces: [8]  
  IfIndex: 1  
  IfDescr: Radio Interface #0  
  IfType: sonet  
  IfMtu: 2430  
  IfSpeed: 367000  
  ...  
  
  IfIndex: 5001  
  IfDescr: Ethernet #7  
  IfType: ethernetCsmacd  
  IfMtu: 1548  
  IfSpeed: 10000000  
  IfPhysAddress: 00:0A:25:27:57:1E  
  IfAdminStatus: up  
  IfOperStatus: down  
  ...
```

`./thola check`

- thola check output per default in check plugin format
- can be used in monitoring tools (e.g. Nagios, Icinga)

./thola check cpu-load

Check CPU usage

```
$ thola check cpu-load --ip 10.207.6.71 --warning 85 --critical 95
```

```
WARNING: average cpu load is 91% | 'cpu_load'=91%;;;
```

./thola api

Start and configure the API

```
● ● ●  
  
$ thola api  
  
-----  
/\_  _\  /\_  _\  /\_  _\  /\_  _\  /\_  _\  
\/_/\  \/  \/  _\  _\  _\  _\  _\  _\  _\  _\  
  \_  _\  \_  _\  _\  _\  _\  _\  _\  _\  _\  
    \_  _\  \_  _\  _\  _\  _\  _\  _\  _\  _\  
  
⇒ http server started on [::]:8237
```

./thola-client

Let the API do the work

```
$ thola-client identify --ip 10.204.2.90  
  --target-api http://192.168.10.20:8237
```

Device:

Class: cerasos/ip10

Properties:

Vendor: Ceragon

Model: IP-10

SerialNumber: 00:0A:25:25:77:67

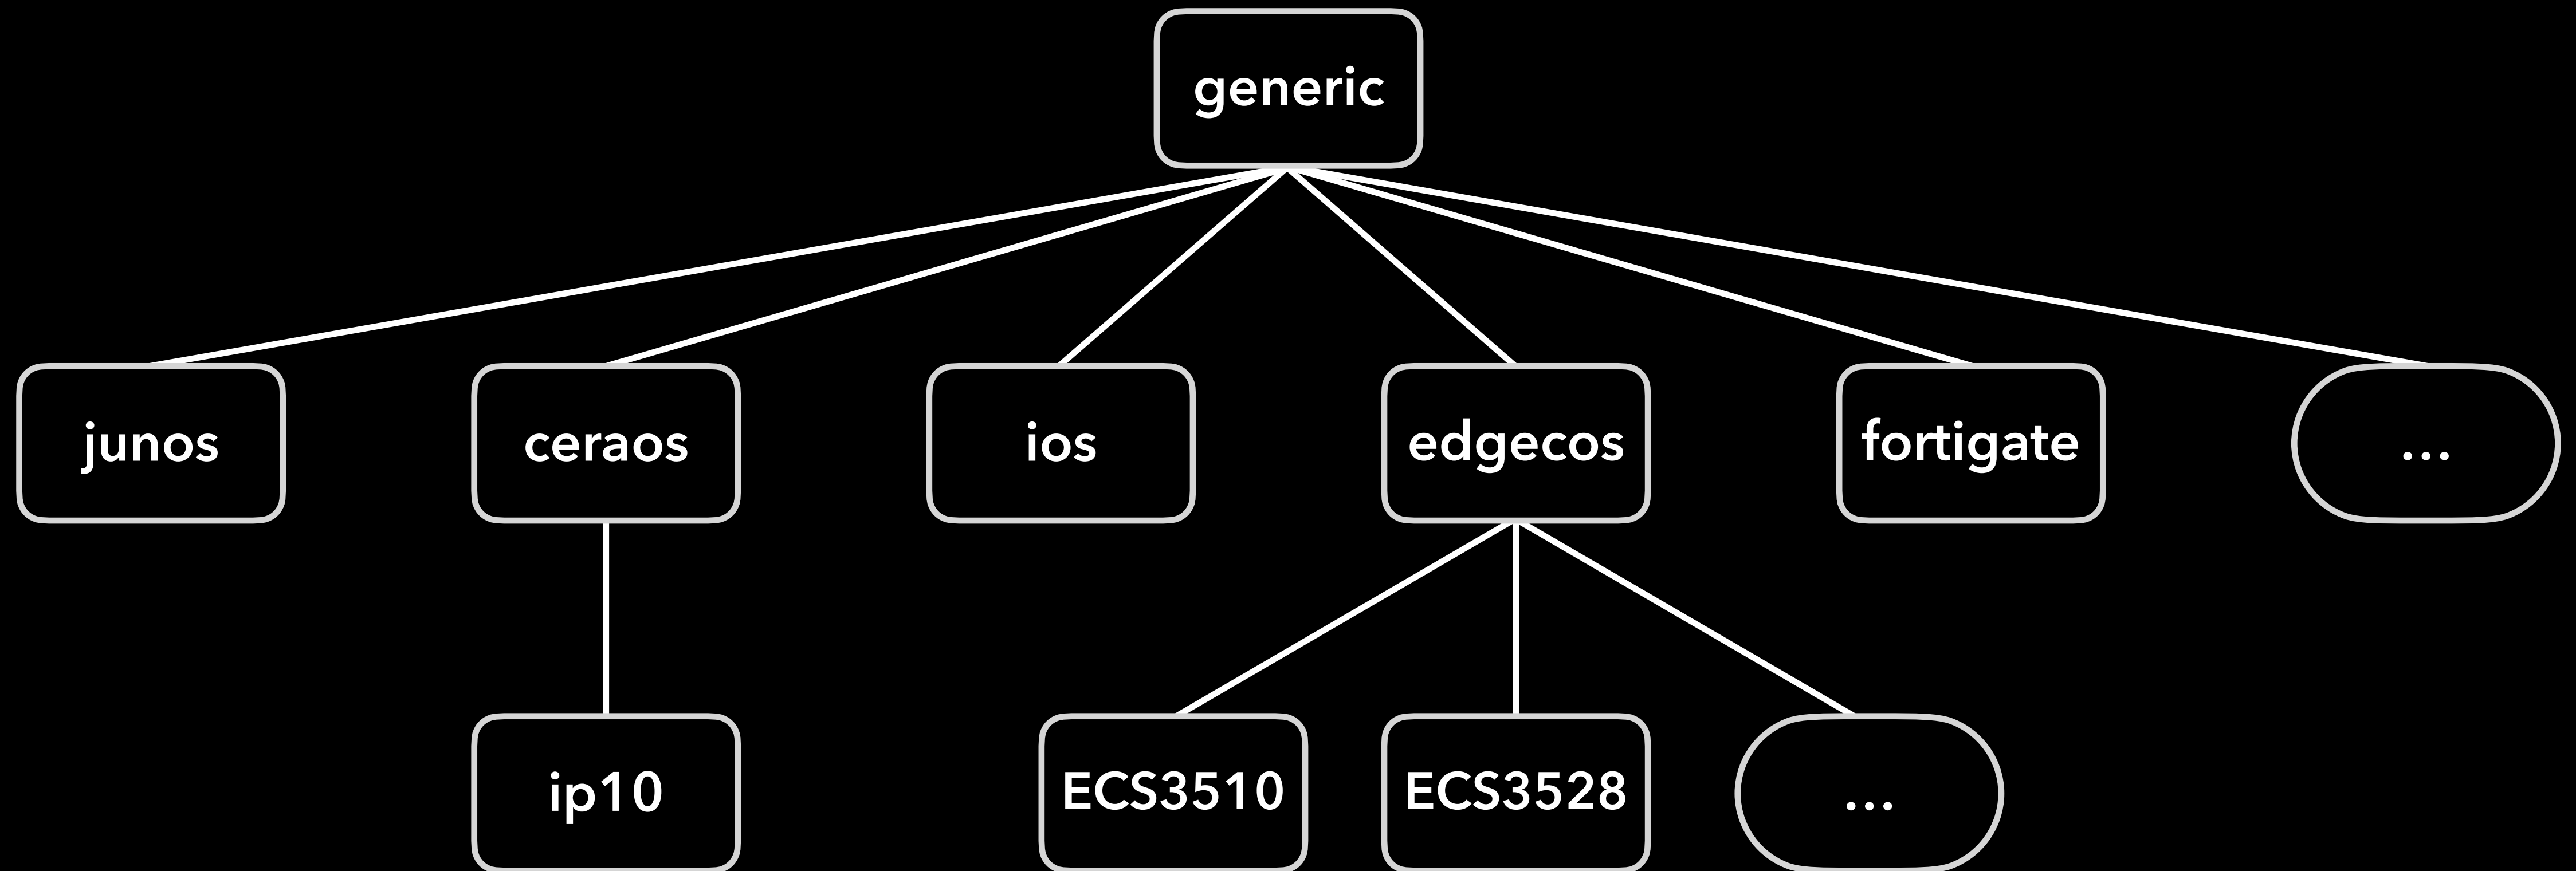

OSVersion: 2.9.25-1

Device classes

Device class content

- conditions for assigning a device to this class
- available operations for the device
- specific network requests for generic operations

Device class hierarchy

Device classes in .yaml

- entire logic in .yaml configuration files
- easy to write
- not bound to a programming language
- embedded in binary
- can be extended with code

Example condition (ios)

```
match:  
  conditions:  
    - type: SysObjectID  
      match_mode: startsWith  
      values:  
        - .1.3.6.1.4.1.9.1.  
    - type: SysDescription  
      match_mode: regex  
      values:  
        - '(?i)^CISCO\s'  
  logical_operator: OR
```

Example model identification (ios)

```
model:  
  - detection: snmpget  
    oid: "1.3.6.1.2.1.47.1.1.1.1.13.1"  
    operators:  
      - type: modify  
        modify_method: regexReplace  
        regex: "(?i)^C(ISCO)?"  
        replace: ""
```

Live Demo
